ESTIMATING CASH FLOWS

Ram Kumar Kakani SPJCM Singapore

Categorizing Cash Flows

- Categorizing cash flows
 - FCFE = Net Income − (Capex − Depreciation) − Δ
 Non-Cash Working Capital + (New debt raised − Debt repaid)
 - FCFF = Operating Income (1 − Tax rate) − (Capex − Depreciation) − Δ Non-Cash Working Capital
- Let us compute these numbers for Wockhardt
- Earnings:
 - Importance of updating earnings
 - Correcting misclassification
 - Capital expenses treated as operating expenses
 - For example, research ... restate earnings and also restate the book value

Restating Earnings Numbers

- Capitalizing R&D Expenses
 - Adjusted book value = book value of equity + value of the research asset
 - Adjusted operating income = operating income +
 R&D expenses amortization of research asset
 - Adjusted net income = net income + R&D expenses
 - amortization of research asset
- Adjustment for Financing Expenses
 - Adjusted debt = debt + present value of lease commitments
 - Adjusted operating income = operating income + operating lease expenses – depreciation on leased asset

In search of True Earnings?

- Techniques for managing earnings
 - Planning income or expenses ahead (especially investments and asset sales)
 - Revenue recognition
 - Book revenues early
 - Capitalize operating expenses
 - Write offs & using reserves
 - Income from investments

In search of True Earnings?

- Extraordinary, recurring, and unusual items
 - One-time expenses or income that is truly one time
 - Expenses and income that do not occur every year but seem to recur at regular intervals
 - Items that recur every year but with volatility
 - Items that recur every year but with change signs – positive in some years and negative in others

Tax Effect

- Effective versus marginal tax rate
 - Reasons for difference (a) following difference accounting standards (b) use tax credits (c) defer taxes to future periods (d) tiered tax structure
 - Marginal tax rates for multinationals
 - Use weighted average of marginal tax rates
 - Use marginal tax rate of the country in which the firm is incorporated
 - Use different marginal tax rate for each country
- Effects of tax rate on value
 - If the same tax rate is to be applied for every period then the safer choice is the marginal tax rate
 - But, what should be the marginal tax rate taken?

Tax effect for a firm in losses!

- In such scenarios, during the years when the losses shelter income ... the tax rate would be zero for both
 - Computation of after tax operating income
 - Cost of capital
- So, you can think of having the following columns for computing cash flows:
 - Year; Revenues; Operating Income; Net Operating Losses at the end of the year; Taxable Income; Taxes; Tax Rate;
- Tax benefits, tax subsidies and tax credits by tax authorities (windmill, backward area, etc.)
- Tax books and reporting books and its complications

Net Capital Expenditure

- Three issues
 - Firms often do capital spending in chunks
 - Can do smoothening
 - Firms with limited information can use the industry averages for capex (depending on size)
 - Go for Net Capex as a percent of EBIT
 - | Bharti Airtel, Jaiprakash Associates || Hexaware Technologies, South Asian Petrochem || Moser Baer, and Wockhardt ||
 - Accounting definition of capex does not include R&D, and similar spending
 - Acquisitions are not classified as capex by accountants

Investment in Working Capital

- Estimating expected changes in non-cash working capital
 - as a percent of revenue can be used, in conjunction with expected revenue changes for each period
 - By looking at the firms history
 - By looking at industry standards
 - Base it on the marginal working capital as a percent of revenues in the most recent year
 - Base our changes on the non-cash working capital as a percent of revenues over a historical period
 - Also try to look at the non-cash working capital relation to assets ratio
 - Remember, firms may have a negative non-cash working capital (especially the large ones!)

Cash Flows to Equity

- Cash Flows to Equity for a Levered Firm at a desired Leverage
 - FCFE = Net Income (1δ) (Capex Depreciation) (1δ) Δ non cash Working Capital
 - Otherwise, it would be, FCFE = Net Income (Capex Depreciation) (Δ non cash Working Capital) + (New debt issued debt repayments)
- Net Income and Accounting Standards
 - China's requirement of statutory reserve
 - Japan's regulation of not taking out any money
 - But the cash therein can be used by the firm internally

FCFF: Cash Flows to the Firm

- Approach 1: Cumulate the cash flows to different claim holders
- Approach 2: Operating Income (1 tax rate) +
 Depreciation Capital Spending Δ Working
 Capital Needs
- We prefer approach 2 for its ease

Inflation, Cash Flows, and Value

- Nominal cash flows do incorporate expected inflation
- Most books do make a small mention of the influence of inflation and relevant formulas
- Real discount rate = Nominal discount rate Expected inflation
- The discounting rule:
 - Real cash flows ~ Real discounting rates
 - Nominal cash flows ~ Nominal discounting rates
 - Cash Flows to Equity ~ Cost of Equity
 - Cash Flows to Firm ~ Cost of Capital

Personal Taxes and Cash Flows

- The effect of personal taxes depends on:
 - What portion, if any, of the cash flows on an asset are taxable?
 - What rate will cash flows be taxed at?
 - When the tax has to be paid?
- Cash flows adjusted for personal taxes have to be discounted at discount rates also adjusted for personal taxes
 - After tax cost of equity = \mathcal{D}_P (1 t_o) + Ω (1 t_{cg})
 - Cost of debt = Interest rates $(1 t_0)(1 t)$
 - Which investors' tax rates are reflected in the markets?

Cash Flows and Asset Life

- Most valuations are done over a finite time horizon
 - For finite life assets, we use salvage value
 - For infinite life assets, we use terminal value
 - In a infinite life asset, capex is needed not only to maintain existing assets but also for future growth
 - In a finite life asset, working capital would be liquidated at the end of asset's life time

Wockhardt	2006	2005	2004	2003
