DIFFERENT ÁPPROACHES TO VALUATION OF SHARES

Ram Kumar Kakani XLRI Jamshedpur

Stocks and Stock Market

- Equity Shares: Ownership shares in a publicly held corporation
- Secondary Market: Market in which already issued securities are traded by investors
- Dividend: Periodic cash distribution from the firm to the shareholders
- Book Value: Net Worth of the firm according to the balance sheet

Stocks and Stock Market

- Liquidation Value: Net proceeds that would be realized by selling the firm's assets and paying off its creditors
- P/E Ratio: Price per share divided by earnings per share (EPS)
- P/BV Ratio: Price per share divided by book value per share (BV)

Valuing Common Equity Shares

- Expected Return: The percentage yield that an investor forecasts from a specific investment over a set period of time.
 - This rate is also known as the <u>opportunity cost</u> of capital

What do you earn when you buy shares?Dividend Yield + Capital Appreciation (??)

Valuing Common Equity Shares

What do you earn when you buy shares?

- Dividend Yield + Capital Appreciation (??)
 - Dividend Discount Models
 - 2-year Model
 - Perpetual Growth Model
 - Constant Growth V = $D_i/(k_e g)$
 - No Growth
 - Growth Phases

Valuation ...

Dividend Discount Model: Computation of today's share price which states that share value equals the present value of all expected future dividends It is the oldest discounted cash flow model in practice

Basic dividend valuation model accounts for the PV of all future dividends.

Adjusted Dividend Valuation Model

The basic dividend valuation model adjusted for the future stock sale.

$$V = \frac{Div_1}{(1 + k_e)^1} + \frac{Div_2}{(1 + k_e)^2} + \dots + \frac{Div_n + Price_n}{(1 + k_e)^n}$$

n:The year in which the firm's
shares are expected to be sold.Price_n:The expected share price in year n.

The constant growth model assumes that dividends will grow forever at the rate g.

$$V = \frac{D_0(1+)}{(1+k_e)^1} + \frac{D_0(1+)^2}{(1+k_e)^2} + \dots + \frac{D_0(1+)^{\infty}}{(1+k_e)^{\infty}}$$

- **D₁:** Dividend paid at time 1.
 - The constant growth rate.
 - Investor's required return.

Constant Growth Model Example

Chambal Fertilisers & Chemicals Limited (CFCL), listed on BSE, has an expected growth rate of 8%. Each common equity share just received an annual Rs. 1.80 dividend per share. The appropriate discount rate is 13%. What is the value of the above shares?

- $D_1 = Rs. 1.80 (1 + .08)$
- $V_{CF} = D_1 / (k_e g) = D_1 / (.13 .08)$ = Rs. 38.9

The growth phases model assumes that dividends for each share will grow at two or more *different* growth rates.

 $V = \sum_{t=1}^{n} \frac{D_0 (1 + 0)^t}{(1 + k_e)^t} + \sum_{t=n+1}^{\infty} \frac{D_n (1 + 0)^t}{(1 + k_e)^t}$

Note that the second phase of the growth phases model assumes that dividends will grow at a constant rate g₂. We can rewrite the formula as:

 $V = \sum_{t=1}^{n} \frac{D_0(1+t)^t}{(1+k_e)^t} + \frac{1}{(1+k_e)^n} \frac{D_{n+1}}{(k_e-g_2)}$

Growth Phases Model Example

Stock Kohinoor Foods has an expected growth rate of 50% for the next 3 years and 7% thereafter. Each share of stock just received an annual Rs. 1.00 dividend per share (on Rs.10 par value). The appropriate discount rate is 12%. What is the value of the common stock under this scenario?

Growth Phases Model Example

Kohinoor Foods has two phases of growth. The first, 50%, starts at time t=0 and is followed by 7% thereafter starting at time 3. We should view the time line as two separate time lines in the valuation.

Note that we can value Phase #2 using the *Constant Growth Model*

We can use this model because dividends grow at a constant 7% rate beginning at the end of Year 3.

Note that we can now replace <u>all</u> dividends from Year 4 to infinity with the *value* at time t=3, V_3 ! Simpler!!

Now we only need to find the first four dividends to calculate the necessary cash flows.

Growth Phases Model Example

Determine the annual dividends. $D_0 = \text{Rs.1.00}$ (this has been paid already) $D_1 = D_0(1+g_1)^1 = \text{Rs.1.00}(1.5)^1 = \text{Rs.1.50}$ $D_2 = D_0(1+g_1)^2 = \text{Rs.1.00}(1.5)^2 = \text{Rs.2.25}$ $D_3 = D_0(1+g_1)^3 = \text{Rs.1.00}(1.5)^3 = \text{Rs.3.37}$ $D_4 = D_3(1+g_2)^1 = \text{Rs.3.37}(1.07)^1 = \text{Rs.3.61}$

Now we need to find the present value of the cash flows.

Valuation ...

- Intrinsic value represents the price a security "ought to have" based on all factors bearing on valuation.
- Intrinsic Value vis-à-vis Market Value

Capitalization Rate

Can be estimated using the perpetuity formula, given minor algebraic manipulation

Determining the Yield on Common Stock

Assume the constant growth model is appropriate. Determine the yield on the common stock. $P_0 = D_1 / (k_e - g)$ Solving for k_e such that $k_e = (D_1 / P_0) + g$

DIFFERENT ÁPPROACHES CONTINUES ...

Ram Kumar Kakani XLRI Jamshedpur

Valuation ...

Dividend Discount Model: Computation of today's share price which states that share value equals the present value of all expected future dividends

- Suppose, a Co-operative Sugar Unit in Uttar Pradesh is up for sale/divestment ... how do you value it?
 - Liquidation Model: Net proceeds that would be realized by selling the firm's assets and paying off its creditors

Valuation ...

Market Value Balance Sheet: Financial statement that uses market value of assets and liabilities

Price Earnings Ratio Model

But, firms are more valuable as going concerns (??) and their ability to generate future cash flows. Market values are more relevant for finance.

Discounted Cash Flow Model

Example

- Kilburn Chemicals is selling for Rs. 50 in the stock market, what might the market be assuming about the growth in dividends?
- It is known that the dividend declared by it in last year was 20%.
- It is given that 15% is the expected return
- Answer: The market is assuming the dividend will grow at 10.6% per year,
 indefinitely.

Valuation ...

- Return Measures
- Dividend Yield = Div_1/P_0
- Return on Equity (ROE) = EPS/BV [a.k.a Return on Net Worth (RONW)]
- What happens if Kilburn Chemicals decides to pay a lower dividend, and reinvest the funds, the stock price may increase because the future dividends may be higher.

Stock price and EPS link

- Payout ratio: Fraction of earnings paid out as dividends
- Ploughback ratio: Fraction of earnings retained by the firm
- Growth can be derived from applying the return on equity to the percentage of earnings ploughed back into operations.

• $P_0 = E_1(1 - b)/(k_e - ROE \times b)$

Stock price and EPS link

So, justified price-earnings ratio becomes $P_0/E_1 = (1 - b)/(k_e - ROE \times b)$ P/E Ratio and Ploughback Ratio If, ROE > k_e then \uparrow in b leads to \uparrow in P/E If, ROE < k_e then \uparrow in b leads to \checkmark in P/E P/E Ratio and Interest Rate P/E Ratio and Risk P/E Ratio and Liquidity

Example

Supreme Petrochemicals Ltd. (SPL) forecasts to pay a Rs. 5.00 dividend next year, which represents 100% of its earnings. This will provide investors with a 12% expected return. Instead, Saket suggests to blow back 40% of the earnings at the firm's current return on equity of 20%. What is the value of the stock before and after the ploughback decision.

Example ... Continued

Answer: If the company did not ploughback some earnings, the stock price would remain at Rs. 41.67. With the ploughback, the price rises to Rs. 75.00

The difference between these two numbers (75.00 – 41.67 = 33.33) is called the Present Value of Growth Opportunities (PVGO)

Share Price ...

- In other words, PVGO is Net Present Value (NPV) of a firm's future investments
- Sustainable Growth Rate: Steady rate at which a firm can grow (= ROE × ploughback ratio)
- Share price = present value of level stream of earnings + present value of growth opportunities

FCF and PV

- Free Cash Flows (FCF) should be the theoretical basis for all PV calculations
- FCF is a more accurate measurement of PV than either Div or EPS
- The market price does not always reflect the PV of FCF
- When valuing a business for purchase, always use FCF

Valuing a business

The value of a business is usually computed as the discounted value of FCF out to a valuation horizon (H)

The valuation horizon is sometimes called the terminal value and is calculated like PVGO.

Book Value

- An accounting measure and can be established easily
- But,
- Accounting conventions and policies are subject to a lot of subjectivity and arbitrariness
- Also, historical figures are quite divergent from current economic value/earnings power

Liquidation Value

- Though it is more realistic than book value
- But,
- It is difficult to estimate the amounts to be realized from the liquidation of various assets
- It also does not reflect earnings capacity of the business
